pests or pathogens.
```

Claim 1; Page 100-101; 124pp; English.

The invention relates to a transgenic plant, comprising a recombinant polynucleotide that alters the plant's disease tolerance or resistance when compared with the same traat of another plant lacking the compared with the same traat of another plant lacking the comprision which encodes a polypeptide comprising at least 6 consecutive amino acids of any of 56 transcription factor proteins appearing as ABO4303-ABO43148. Also included are altering the disease consecutive amino acids of any of 56 transcription factor proteins appearing as ABO4303-ABO43148. Also included are altering the disease colerance or resistance of a plant by: (a) transforming a plant with the companionat polynucleotide; (b) selecting the transforming plant with an altered disease tolerance or resistance). Altering the plant with the recombinant polynucleotide, caltering a plant's trait (comprising: (a) providing a database sequence; (b) comparing the plant with the polypeptide or altering a plant's trait (comprising: (a) providing a database sequence; (b) selecting a database sequence; (c) selecting a database sequence; (d) providing a test polynucleotide or caltering a plant's trait (comprising: c) polynucleotide cited above; (c) selecting a plant's trait (comprising: c) polynucleotide at low stringency with the recombinant polynucleotide in the plant) and altering a plant's trait (comprising: c) polynucleotide at low stringency with the recombinant polynucleotide in the plant predding particularly for generating plants with improved cotted above, and (c) transforming the hybridising test polynucleotide in the plant predding plants with improved conference or resistance to generating plants with improved colerance or resistance to pathogens and pests. The function factor of the formulation

Protein Sequence Searches - February 2005

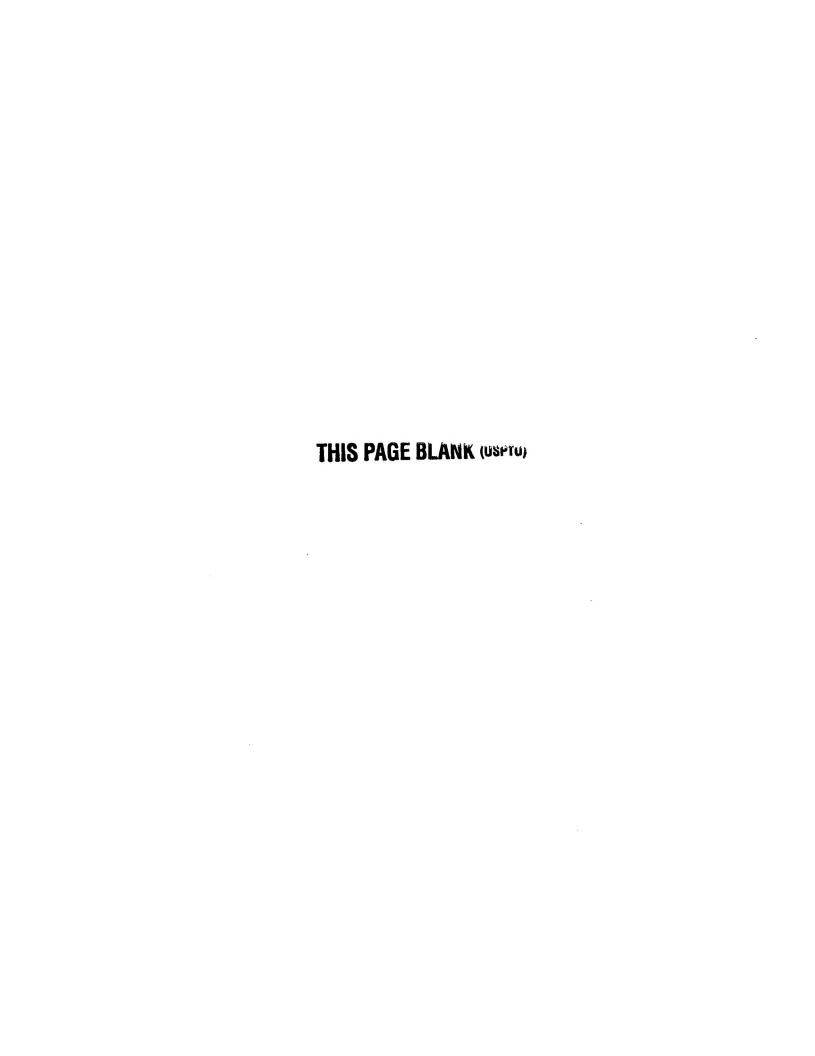

All of the sequence databases on ABSS have recently been updated.

- permanent accession numbers. The new UniProt record may not contain the previous temporary numbers from the most recent version of UniProt. These sequences have been assigned new Please note that the curators of the UniProt database have purged some temporary accession
- extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein If you encounter an accession number from an older search run against UniProt (results file

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                 1 MAFQQSSPLVKFEASPAESF.....QPQSGASSHGCDDGGIAVGV 451

Cox J.S., Walter P.;

Cox J.S., Walter P.;

A novel mechanism for regulating activity of a transcription factor that controls the unfolded protein response.";

Cell 87:391-404(1996).

-I-FUNCTION: Seems to be involved in the unfolded protein response (UPR) pathway. Binds to the UPR element (UPRE) in the promoter of UPR-regulated genes such as KAR2, PDII, EUGI and FKB2; activates the transcription of these genes.

-I-SUBUNIT: Homodimer.

-I-SUBCHILLIAR LOCATION: Nuclear (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=S288c;

myosin X - bovine C;Species: Bos primigenius taurus (cattle) C;Date: 15-Oct-1999 #sequence\_revision 15-Oct-1999 #text\_change 09-Jul-2004

```
Victory, D.P.; Derfler, B.H.; Solc, C.K.; Duyk, G.M.; Cheney, R.E. submitted to the EMBL Data Library, April 1996
A;Description: Cloning and expression of myosin X, a novel unconventional myosin with plt A;Reference number: Z18942
A;Reference number: Z18942
A;Accession: T18519
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Status: preliminary; translated from GB/EMBL/DDBJ

Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein

Claim 39; Fig 7; 56pp; English.

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the playered in increasing the presence of proteins such as HAC1, HAC4, PTC2 or IRL1 in cells. The method and sequences are useful for increasing the secretion

```
The present sequence is that of the HAC1 protein of Trichoderma reesei, as deduced from the newly isolated HAC1 gene (see AAH26931). HAC1 protein is a transcription factor involved in the unfolded protein response (UPR). The invention provides methods for increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be achieved by modulating the activity of HAC1, PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, yeast and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme, e.g. lipase, cellulase, endoglucanase-H, protease, carbohydratase, reductase, cilucamylase, ilgnocellulose hemicellulase, pectinase and ligninase (claimed). (Updated on 11-SEP-2003 to standardise OS field)

 The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HACI, HACA, PTC2 or IREI in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an electrologous protein in a eukaryotic cell, comprising inducing an electrologous protein response (URP). Also described are an included nucleic acid encoding a HACI protein induces in induces unfolded protein response and has less than 50% samilarity to years HACI protein, where the HACI protein, where the HACI protein, where the HACI protein, where the HACI protein induces unfolded protein response and where the HACI protein. Where the HACI protein and the response inducing and where the HACI protein a protein paying unfolded protein response inducing activity and having protein having unfolded protein response inducing activity and having an amino acid sequence of SEQ ID NO: 2, 4 or 16, or 12 or 14, and the specification; a protein having an amino acid sequence of SEQ ID NO: 2, 4, 8, 10, 12, 14 or 16; an animal and the sequence of 130 or 438 amino acids (SEQ ID NO: 8 or 10; an animal response and has at least 70% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 or 14; a protein modulates unfolded protein response and has at least 70% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 or 14; a protein than 70% similarity to SEQ ID NO: 8 or 10; and a cell containing a heterologous nucleic acid encoding a protein having unfolded protein response modulating activity and having quadrating activity and a cetivity and a cell containing a protein of interest to be secreted. The methods and compositions of protein of interest to be secreted. The methods and compositions of proteins, are useful in e.g. production. In the protein of interest to be secreted. The methods and compositions of proteins, are useful in e.g. production. In the protein of interest to be secreted. The methods and compositions of chaperone and foldase.
 Increasing the secretion of a heterologous protein, such as a thereby or an industrial enzyme, in genetically modified eukarycitic ceils ty inducing an elevated unfolded protein response (198).

The present invention relates to the isolation of plant (Arabidopsis thaliana) transcription factor polypeptide and polynucleotide sequences. Also disclosed are: an expression vector comprising the isolated polynucleotide, a host cell comprising the expression vector, a transgenic plant comprising the isolated polynucleotide, a transgenic plant ectopically expressing the isolated polynucleotide, a transgenic plant trait by placing the molecule to identify a molecule that modifies a plant trait by placing the molecule in contact with the plant, and monitoring the effect of the molecule on the expressing or activity of the polypeptide or polynucleotide, and producing a transgenic plant having a modified trait by ectopically expressing the isolated polypeptide and selecting a plant with the modified trait. The polypeptides polynucleotides and methods are useful for screening a molecule to identify a molecule that modifies plant trait, and for producing plants with modified traits. The present sequence represents a plant transcription factor polypeptide of the invention. Note: The concentration, but was obtained in electronic format directly from the

Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein response

Claim 54; Fig 28A-C; 89pp; English.

The present sequence is that of the hacA protein of Aspergillus niger var. awamori, as deduced from hacA cDNA (see AAH26933). HacA protein is a transcription factor involved in the unfolded protein response (UPR).

Coverexpression of an inducing form of hacA enables production of higher levels of secreted heterologous proteins in A. niger. The invention provides methods for increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be achieved by modulating the activity of HAC1 (or hacA), PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect calls, yeast and sillamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme, e.g. lipase, cellulase, endoglucanase-H, protease, carbohydratase, reductase, oxidase, isomerase, transferase, kinase, phosphatase, alpha-amylase, glucoamylase, lignocellulose hemicallulase, postinase and ligninase (claimed). (Updated on 11-SBP-2003 to standardise OS field)

 Cox J.S., Walter P.;

"A novel mechanism for regulating activity of a transcription factor that controls the unfolded protein response.";

Cell 87:391-404(1996).

-1- FUNCTION: Seems to be involved in the unfolded protein response (UPR) pathway. Binds to the UPR element (UPRE) in the promoter of UPR-regulated genes such as KAR2, PDII, EUGI and FKB2; activates the transcription of these genes.
-1- SUBGUNIT: Homodiame.
-1- SUBCELLULAR LOCATION: Nuclear (Probable).

 Score 1/1...,
Pred. No. 5.1e-08;
 Event=Alternative splicing, Named isoforms=2;
Comment=The level of each isoform is regulated by
event that occurs when the UPR is induced by IRB1;
 Note-Active and stable isoform which induces UPR; SIMILARITY: Belongs to the bZIP family. SIMILARITY: Contains 1 bZIP domain.

Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).

Example 3; SEQ ID NO 6; 83pp; English.

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1 protein, an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and where the HAC1 protein comprises a DNA binding region that has greater than 70% similarity to the DNA binding region of filamentous fungi HAC1 protein, a protein having unfolded protein response inducing activity and having greater

```
than 70% similarity to a fully defined amino acid sequence of 451, 349 or 286, or 504 or 1232 amino acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, acid sequence of SEQ ID NO: 2, 4, 8, 10, 12, 14 or 16, an isolated acid sequence of SEQ ID NO: 2, 4, 8, 10, 12, 14 or 16, an isolated acid sequence of SEQ ID NO: 2, 4, 8, 10, 12, 14 or 16, an isolated nucleic acid encoding a PTC2 protein that modulates unfolded protein response and has at least 70% similarity to a fully defined amino acid sequence of 110 or 438 amino acids (SEQ ID NO: 8 or 10) as given in the specification; an isolated nucleic acid encoding a IRE1 protein that modulates unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 or 14; a protein having unfolded protein response modulating activity and having unfolded protein response modulating activity and having unfolded protein response modulating activity and a heterologous nucleic acid encoding a protein having unfolded protein response modulating cells to have an elevated unfolded protein response (URP) resulting in an increased capacity to produce secreted proteins, are useful in e.g. production of therapeutic or industrial enzymes. This is the amino acid sequence of Aspergillus nidulans HACI chaperone and foldase DNA binding domain.

The present sequence is that of the hacA protein of Aspergillus nidulans, as deduced from the newly isolated hacA gene (see AAH2632). HacA protein is a transcription factor involved in the unfolded protein response (UPR). The invention provides methods for increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be achieved by modulating the activity of HAC1 (or hacA), PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, yeast and filamentous fungi. The protein of interest can be any escreted by rotein sea a therapeutic protein of interest can be any reductase, oxidase, isomerase. The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1

```
The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HACl protein, where the HACl protein induces unfolded protein response and has less than 50% similarity to yeast HACl
 ö
 Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).
 The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HAC1, HAC4, PTC2 or IRE1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is that of the HAC1 protein of Trichoderma reesei, as deduced from the newly isolated HAC1 gene (see AAH2631). HAC1 protein is a transcription factor involved in the unfolded protein response (UPR). The invention provides methods for increasing the secretion of a actieved by modulating the activity of HAC1, PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, protein and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme, e.g. lipase, cellulase, endoglucanase-H, protease, carbohydratase, reductase, gluccamylase, isomerase, transferase, kinase, phosphatase, alpha-amylase, gluccamylase, lignocellulose hemicellulase, pectinase and ligninase (claimed). (Updated on 11-SEP-2003 to standardise OS field)

Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein

Example 3; Fig 10; 56pp; English.

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (URR). The method involves inducing the elevated URR by increasing the presence of proteins such as HAC1, HAC4, PTC2 or IRE1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipse, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Trichoderma resesi HAC1 protein DNA binding domain. (Updated on 29-AUG-2003 to standardise OS

 The present sequence is that of the HAC1 protein of Trichoderma reesei, as deduced from the newly isolated HAC1 gene (see AAH26931). HAC1 protein is a transcription factor involved in the unfolded protein response (UPR). The invention provides methods for increasing the secretion of a achieved by modulating the activity of HAC1, PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, peats and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or industrial enzyme, e.g. lipase, cellulase, endoglucanase-H, protease, carbohydratase, reductase, oxidase, isomerase, transferase, kinase, phosphatase, alpha-amylase, glucoamylase, lignocallulose hemicallulase, pectinase and ligninase (claimed).  The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HAC1, HAC4, PTC2 or IRR1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Trichoderma reesei HAC1 protein. (Updated on 29-AUG-2003 to standardise OS field)
 Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein
 Heterologous protein secretion; unfolded protein response; UPR; lipase; cellulase; carbohydrase; industry; purification; HAC1 protein.

The invention relates to a transgenic plant, comprising a recombinant polynucleotide that alters the plant's disease tolerance or resistance or polynucleotide that alters the plant's disease tolerance or resistance or more when compared with the same trait of another plant lacking the comprision of a consecutive amino acids of any of Sc transcription factor proteins appearing as ABO43093-ABO43148. Also included are altering the disease tolerance or resistance of a plant (by: (a) transforming a plant with the recombinant polynucleotide; (b) selecting the transforming a plant with the recombinant polynucleotide; (b) selecting the recombinant polynucleotide; (c) selecting the plant with the recombinant polynucleotide. The selected sequence or altering the database sequence with the polypeptide or plant by transforming the database sequence with the polypeptide or polynucleotide cited above; (c) selecting a database sequence; (d) providing a test polynucleotide; (b) transforming the selected above; (c) selecting a database sequence or triteria; and (d) transforming the test comprising: (a) providing a test polynucleotide; (b) hybridising the test comprising: (c) a plant by the resimple or a plant of the plant; and (d) transforming the test comprising: (e) plant breeding, particularly for generating plants with improved the relation or the relation of the plant; the plants have commercial utility for increasing tolerance or resistance to diseases. The plants have commercial utility for increasing tolerance to resistance to pathogens and peets. The increasing tolerance or resistance to pathogens and peets. The increasing tolerance to resistance to pathogens and peets. The increasing tolerance or resistance to pathogens and peets. The increasing tolerance or resistance to pathogens and peets. The increasing tolerance or resistance to pathogens and peets. The increasing tolerance or resistance to pathogens and peets. The increasing tolerance or resistance to pathogens and peets. The increasing tolerance or resistance t New tranagenic plants comprising a recombinant gene that alters the plant's disease tolerance or resistance, useful in plant breeding, e.g. for generating plants with improved tolerance or resistance to diseases.  The present invention relates to the isolation of plant (Arabidopsis thaliana) transcription factor polypeptide and polymucleotide sequences. Also disclosed are: an expression vector comprising the isolated polymucleotide, a host cell comprising the expression vector, a plant comprising the isolated polymucleotide, a transgenic plant comprising the isolated polymucleotide, a transgenic plant ectoplocally expressing the isolated polymucleotide a transgenic plant trait by placing the molecule to identify a molecule that modifies a method for screening a molecule to identify a molecule that modifies a plant trait by placing the molecule on the expressing or activity of the polypeptide or polymucleotide, and producing a transgenic plant having a modified trait by ectoplically expressing the isolated polypeptides and selecting a plant with the modified trait. The polypeptides and selecting a plant with the modified trait, and for producing plants with modified traits. The present sequence represents a producing plants with modified traits. The present sequence represents a plant transcription factor polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence.
 New isolated polypeptides and polynucleotide sequences, useful for screening a molecule to identify a molecule that modifies plant trait, and for producing plants with modified traits.

Wang H, 23-MAR-2001; 2001WO-US009401. 24-MAR-2000; 2000US-00534692. (GEMV ) GENENCOR INT INC. Penttila ME, Ward M, WPI; 2001-626252/72. Aspergillus awamori N-PSDB, AAH26933 WO200172783-A2 response 

The present sequence is that of the hacA protein of Aspergillus niger var. awamori, as deduced from hacA cDNA (see AAH26931). HacA protein is a transcription factor involved in the unfolded protein response (UPR).

Overexpression of an inducing form of hacA enables production of higher levels of secreted heterologous proteins in A. niger. The invention provides methods for increasing the secretion of a heterologous protein an activity of HAC1 (or hacA), PTC2 or IRB1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, yeast and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme, e.g. lipase, sendiglucanase-H, protease, carbohydratase, reductase, oxidase, isomerase, transferase, kinase, phosphatase, alpha-amylase, glucoamylase, ligomerase, transferase, kinase, poctinnse and ligninase (claimed).  Increasing secretion of heterologous proteins e.g. lipase and cell
in eukaryotic cells useful in industry to increase production and
facilitate purification, by inducing an elevated unfolded protein

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an electrologous protein in a eukaryotic cell, comprising inducing an electrologous protein in a eukaryotic cell, comprising inducing an electrologous protein induces cell encoding a HACI protein, where the HACI protein induces unfolded protein response and has less than 50% similarity to yeast HACI protein induces unfolded protein response and where the HACI protein induces unfolded protein response and where the HACI protein protein induces a DNA binding region that has gracter than 70% similarity to fill mentous fungi HACI protein, a protein comprises a DNA binding region of filamentous fungi HACI protein, a protein than 70% similarity to a fully defined amino acid sequence of SEQ ID NO: 2, 4 or 16, or 12 or 14, and 70% similarity to a fully defined amino acid sequence of SEQ ID NO: 2, 4 or 16, or 12 or 14, and 70% similarity to a fully defined amino acid sequence of SEQ ID NO: 2, 4 or 16, or 18 or
 ö
 Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).
